Traffic Law Enforcement

Why traffic law enforcement?
Most drivers involved in traffic crashes do not comply with speed limits, blood alcohol levels and/or the EU-wide obligation to wear safety belts. These are the three most important factors contributing to traffic deaths and injuries in Europe.

- Drivers with BAC levels over the legal limit cause at least 6,800 road deaths every year in the EU.
- Drivers exceeding the speed limit cause about one third of all fatal and serious accidents.
- More than half of the 22,500 car occupants killed in the EU every year could survive the crash if they were wearing their seat belt.

Safety rules have been adopted to guide drivers in their behaviour. Many road users comply with them willingly. Many others, however, would not comply if it were not for fear of being detected and punished. This is where traffic law enforcement comes in.

How does it work?
Enforcement is a means to prevent accidents from happening by way of making drivers comply with the safety rules. It is based on giving drivers the feeling that they run a too high risk of being caught and punished when breaking the rules. Efficient enforcement strategies are therefore not in the first place about increasing the actual number of controls, but about increasing the risk of being caught as perceived by the drivers.

How effective is police enforcement in Europe?
If enforcement is there primarily to put drivers off committing safety offences, then current strategies are in many cases missing their goal. In most EU countries, both the subjective and objective risk of detection is very small.

In relation to alcohol for example, more than two thirds of European drivers feel they will “never” or “rarely” be checked according to a recent EU survey. The actual probability of being breath-tested is also very low. ETSC estimates that, on average, 1 in 16 inhabitants are tested every year in the EU.

Why should it be improved?
While education and engineering improve safety in the longer term, effective enforcement leads to a rapid reduction in deaths and injuries.

In France, the number of road deaths dropped by 20.9% in 2003, compared with the year 2002. The most important measure taken in that year was the improvement of speed and seat belt enforcement, accompanied by an increase in penalties and strong media coverage.

- Sustained intensive enforcement that is well explained and publicised also has a long-lasting effect on drivers’ behaviour.

In Finland, the police has pursued a systematic DUI (= driving under influence) surveillance for over a quarter of a century. The number of those caught for drunk driving has fallen during the past 10 years from 0.33% to 0.14%.

- Traffic law enforcement is a very cost-effective means of enhancing road safety. The benefits of applying existing best practice in enforcement to the whole of the EU exceed the costs by a factor of 4 (drink driving) to 10 (seat belt use).

- Traffic law enforcement is supported by a large share of the European public. 70% of European drivers are (strongly) in favour of more enforcement of traffic laws, according to an EU survey carried out in 1996-97.

EU activities related to traffic law enforcement
Taking into account both the actual state and the potential benefits of police enforcement, the European Commission has decided to publish a Recommendation to the Member States on how to improve the current situation. The Recommendation focuses on planning, implementing and reporting on intensified enforcement related to speeding, drink-driving and the non-use of seat belts. By April 2007, the Commission will evaluate, on the basis of Member States’ reports, whether or not enforcement policies have improved sufficiently. If this is not the case, the Commission says it will propose more binding legislation, i.e. a Directive.

How can traffic law enforcement be improved?
Indicators and targets to plan and evaluate actions
To better plan, monitor and evaluate enforcement actions, behaviour performance indicators should be used that are related to the three key areas of road user behaviour: blood alcohol level, speed and use of seat belts.

The use of such indicators requires specially designed monitoring systems to survey these aspects of road user behaviour. The experience in countries that have set up such systems shows that policymakers are more engaged with their policies if indicator data are reported to them regularly.
**Drink driving: random breath testing**

To enforce blood alcohol levels, the police should use random breath testing. This means that large-scale actions should be carried out in which all cars at a certain stretch are systematically stopped and their drivers tested, whether there is a suspicion or not. This type of testing should be carried out preferably, but not only, at times and places where drinking drivers are likely to be found, e.g. on Friday and Saturday nights. The testing frequency should amount to at least 1 test per 16 inhabitants (the current EU average) in every Member State.¹¹

**Speeding: safety cameras**

Speed cameras have proven to be a very useful tool to enforce speed limits. UK studies have shown that during two years a 35% reduction in people killed and seriously injured can be achieved at camera sites, compared to the long-term trend. A long-term study carried out over a period of twelve years has concluded that cameras can reduce collisions involving injury by an astounding 46%.¹²

**Seat belt use: separate ‘blitz’ enforcement**

Currently, seat belt enforcement either results from routine general surveillance or is a by-product of the enforcement of some other law. Actions should be carried out separately, and they should be intensive, highly visible and well publicised. Studies have shown that repeated ‘blitz’ actions, lasting only one to four weeks, can be very effective.¹³

**Publicity to increase awareness and acceptance**

To make sure drivers are aware of the likelihood of being caught in controls, enforcement actions must go hand in hand with intensive and continuing publicity, both in the media and on the roadside.

**Are there alternatives to police enforcement?**

Intensive police enforcement swallows a lot of precious resources of both the police force and legal authorities. In the future, other compliance enhancing tools could be used more extensively. Cars and roads could be designed in such a way that the opportunities for drivers to commit errors and traffic law offences are limited.

**A scenario: Intelligent enforcement**

Self-enforcing cars are fitted with different technologies that assist the driver and other occupants in respecting all sorts of safety rules. In a first period, devices are used that detect offences and provide feedback to the driver (e.g. audible seat belt reminders). When sufficient public acceptance has been achieved, devices are introduced that actually limit drivers’ options of committing traffic law offences (e.g. intelligent speed adaptation, ISA, and ignition interlock systems).¹⁴

Self-enforcing roads help drivers stick to the legal speed limit by indicating the appropriate speed for different stretches of road. Their design is based on a road hierarchy according to function.
